LIQUID OXYGEN BLEACH

This product is an effective liquid bleaching compound containing Hydrogen Peroxide. It is also ideally suited for use as a sanitizer in food plants and other industrial applications.

It is an excellent alternative for bleaching operations where the use of chlorine bleach is undesirable, as in areas with high iron content. It can be used safely on wools, silks and most synthetic fibres and will not cause a yellowing colour on white synthetic fibres and may be used on coloured fabrics.

DIRECTIONS: It is recommended that this product be used in the wash cycle at 2 -3 oz per 50 lbs of fabric. Amount used will depend on soil and stain. When used as a sanitizer, all food contact surfaces should be thoroughly rinsed with potable water.

PRE-SOAKING: Soaking may be required for very heavy or set stains. Soak the laundry in product solution for 1/2 to 4 hours and then wash normally. Better results are obtained when some detergent or water conditioner is used along with the bleach in the presoaking.

It can be used as is for spot bleaching.

NOTE: When washing coloured fabrics, make sure to test dye for color fastness.
